fusion/coalescence analysis is possible (see Takahashi, 2019)

- $C_1C_2 \rightarrow C_{1,2}$
VCV $\rightarrow$ VCV
- violates UNIFORMITY (McCarthy and Prince, 1999:296)

I don't have a good empirical example of this, but a coalescence account still requires positional faithfulness, undercutting the advantage of CODA COND

(4)

		CODA COND	*PLACE/affix	UNIFORMITY
	/at-ma/			
	a. .at.ma.	W 1	1	L
●*	b. .a.t _{1,2} a.		L	1
☹	c. .a.m _{1,2} a.		1	1

see Lamont (2025) for discussion/survey of coalescence vs. deletion
